

DSL Setup: Mac OSX

1. Simply plug in modem and make all connections to your computer (see "Configuration" image below).
2. Restart computer, and go online.

Note: If this does not work, your Mac needs to be configured to automatically obtain an IP. To do this use the following procedure.

1. Click on Apple menu --> System Preferences --> double click Network
2. Select Location --> New Location --> type All West and click OK
3. Show --> Built-in Ethernet
4. Configure --> Using DHCP
5. Click "Apply Now" and close the window

Note: Your DSL modem may look different to the one pictured above.
